

OPA336
OPA2336
OPA4336

SINGLE-SUPPLY, *MicroPOWER* CMOS OPERATIONAL AMPLIFIERS *MicroAmplifier™* Series

FEATURES

- SINGLE SUPPLY OPERATION
- RAIL-TO-RAIL OUTPUT (within 3mV)
- *MicroPOWER*: $I_Q = 20\mu\text{A}/\text{Amplifier}$
- *MicroSIZE* PACKAGES
- LOW OFFSET VOLTAGE: 125 μV max
- SPECIFIED FROM $V_S = 2.3\text{V}$ to 5.5V
- SINGLE, DUAL, AND QUAD VERSIONS⁽¹⁾

APPLICATIONS

- BATTERY POWERED INSTRUMENTS
- PORTABLE DEVICES
- HIGH IMPEDANCE APPLICATIONS
- PHOTODIODE PRE-AMPS
- PRECISION INTEGRATORS
- MEDICAL INSTRUMENTS
- TEST EQUIPMENT

DESCRIPTION

OPA336 series micropower CMOS operational amplifiers are designed for battery powered applications. They operate on a single supply with operation as low as 2.1V. The output is rail-to-rail and swings to within 3mV of the supplies with a 100k Ω load. The common-mode range extends to the negative supply—ideal for single-supply applications. Single⁽¹⁾, dual, and quad⁽¹⁾ versions have identical specifications for maximum design flexibility.

In addition to small size and low quiescent current (20 $\mu\text{A}/\text{amplifier}$), they feature low offset voltage (125 μV max), low input bias current (1pA), and high open-loop gain (115dB). Dual and quad designs feature completely independent circuitry for lowest crosstalk and freedom from interaction.

OPA336 packages are the tiny 5-lead SOT-23-5, SO-8 surface-mount, and 8-pin DIP. OPA2336 comes in the miniature MSOP-8 surface-mount, SO-8 surface-mount, and 8-pin DIP packages. OPA4336 packages are the space-saving SSOP-16 surface-mount and the 14-pin DIP. All are specified from -40°C to $+85^\circ\text{C}$ and operate from -55°C to $+125^\circ\text{C}$. A macromodel is available for design analysis.

NOTE: (1) Single and quad versions available 3Q'97.

SPECIFICATIONS: $V_S = 2.3V$ to $5.5V$

At $T_A = +25^\circ C$, and $R_L = 25k\Omega$ connected to $V_S/2$, unless otherwise noted.

Boldface limits apply over the specified temperature range, $-40^\circ C$ to $+85^\circ C$. $V_S = +5V$.

PIN CONFIGURATIONS

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Supply Voltage	5.5V
Signal Input Terminals, Voltage ⁽²⁾	(V-) -0.3V to (V+) +0.3V
Current ⁽²⁾	10mA
Output Short-Circuit ⁽³⁾	Continuous
Operating Temperature	-55°C to +125°C
Storage Temperature	-55°C to +125°C
Junction Temperature	150°C
Lead Temperature (soldering, 10s)	300°C

NOTES: (1) Stresses above these ratings may cause permanent damage. (2) Input terminals are diode-clamped to the power supply rails. Input signals that can swing more than 0.3V beyond the supply rails should be current-limited to 10mA or less. (3) Short-circuit to ground, one amplifier per package.

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTES: (1) For detailed drawing and dimension table, please see end of data sheet, or Appendix C of Burr-Brown IC Data Book. (2) Models with -250, -2500, and -3K are available only in Tape and Reel in the quantities indicated (e.g., -250 indicates 250 devices per reel). Ordering 3000 pieces of "OPA336NA-3K" will get a single 3000 piece Tape and Reel. For detailed Tape and Reel mechanical information, refer to Appendix B of Burr-Brown IC Data Book. (3) Grade will be marked on the Reel. (4) SO-8 models also available in Tape and Reel.

*Single and quad models available 3Q'97.

TYPICAL PERFORMANCE CURVES

At $T_A = +25^\circ\text{C}$, $V_S = +5\text{V}$, and $R_L = 25\text{k}\Omega$ connected to $V_S/2$, unless otherwise noted.

TYPICAL PERFORMANCE CURVES (CONT)

At $T_A = +25^\circ\text{C}$, $V_S = +5\text{V}$, and $R_L = 25\text{k}\Omega$ connected to $V_S/2$, unless otherwise noted.

TYPICAL PERFORMANCE CURVES (CONT)

At $T_A = +25^\circ\text{C}$, $V_S = +5\text{V}$, and $R_L = 25\text{k}\Omega$ connected to $V_S/2$, unless otherwise noted.

SMALL-SIGNAL STEP RESPONSE
 $G = 1$, $C_L = 200\text{pF}$, $V_S = +5\text{V}$

LARGE-SIGNAL STEP RESPONSE
 $G = 1$, $C_L = 620\text{pF}$, $V_S = +5\text{V}$

APPLICATIONS INFORMATION

OPA336 series op amps are fabricated on a state-of-the-art 0.6 micron CMOS process. They are unity-gain stable and suitable for a wide range of general purpose applications.

Power supply pins should be bypassed with 0.01 μ F ceramic capacitors.

OPERATING VOLTAGE

OPA336 series op amps can operate from a +2.1V to +5.5V single supply with excellent performance. Most behavior remains unchanged throughout the full operating voltage range. Parameters which vary significantly with operating voltage are shown in the typical performance curves. OPA336 series op amps are fully specified for operation from +2.3V to +5.5V; a single limit applies over the supply range. In addition, many parameters are guaranteed over the specified temperature range, -40°C to $+85^{\circ}\text{C}$.

INPUT VOLTAGE

The input common-mode range of OPA336 series op amps extends from $(V-)-0.2\text{V}$ to $(V+)-1\text{V}$. For normal operation, inputs should be limited to this range. The absolute maximum input voltage is 300mV beyond the supplies. Thus, inputs greater than the input common-mode range but less than maximum input voltage, while not valid, will not cause any damage to the op amp. Furthermore, the inputs may go beyond the power supplies without phase inversion (Figure 1) unlike some other op amps.

FIGURE 1. No Phase Inversion with Inputs Greater than the Power Supply Voltage.

Normally, input bias current is approximately 1pA. However, input voltages exceeding the power supplies can cause excessive current to flow in or out of the input pins. Momentary voltages greater than the power supply can be tolerated as long as the current on the input pins is limited to 10mA. This is easily accomplished with an input resistor as shown in Figure 2.

FIGURE 2. Input Current Protection for Voltages Exceeding the Supply Voltage.

CAPACITIVE LOAD AND STABILITY

OPA336 series op amps can drive a wide range of capacitive loads. However, all op amps under certain conditions may become unstable. Op amp configuration, gain, and load value are just a few of the factors to consider when determining stability.

When properly configured, OPA336 series op amps can drive approximately 10,000pF. An op amp in unity gain configuration is the most vulnerable to capacitive load. The capacitive load reacts with the op amp's output resistance, along with any additional load resistance, to create a pole in the response which degrades the phase margin. In unity gain, OPA336 series op amps perform well with a pure capacitive load up to about 300pF. Increasing gain enhances the amplifier's ability to drive loads beyond this level.

One method of improving capacitive load drive in the unity gain configuration is to insert a 50 Ω to 100 Ω resistor inside the feedback loop as shown in Figure 3. This reduces ringing with large capacitive loads while maintaining DC accuracy.

FIGURE 3. Series Resistor in Unity-Gain Configuration Improves Capacitive Load Drive.

FIGURE 4. Small-Signal Step Response Using Series Resistor to Improve Capacitive Load Drive.

For example, with $R_L = 25k\Omega$, OPA336 series op amps perform well with capacitive loads in excess of 1000pF (Figure 4). Without R_S , capacitive load drive is typically 350pF for these conditions (see Figure 5).

Alternatively, the resistor may be connected in series with the output outside of the feedback loop. However, if there is a resistive load parallel to the capacitive load, it and the series resistor create a voltage divider. This introduces a DC error at the output. However, this error may be insignificant. For instance, with $R_L = 100k\Omega$ and $R_S = 100\Omega$, there is only about a 0.1% error at the output.

Figure 5 shows the recommended operating regions for the OPA336. Decreasing the load resistance generally improves capacitive load drive. Figure 5 also illustrates how stability differs depending on where the resistive load is connected. With $G = +1$ and $R_L = 10k\Omega$ connected to $V_S/2$, the OPA336 can typically drive 500pF. Connecting the same load to ground improves capacitive load drive to 1000pF.

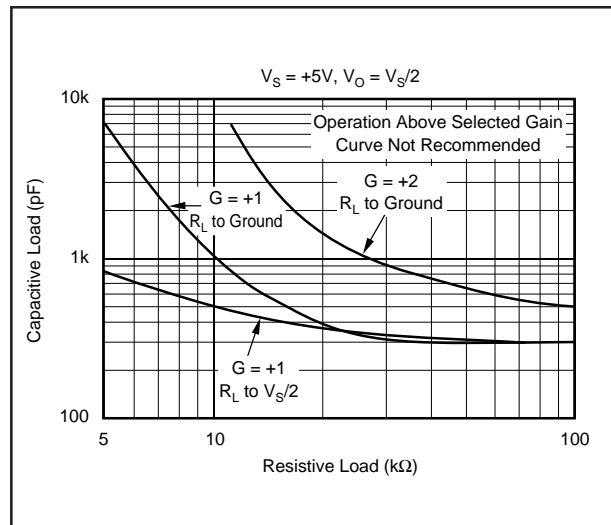

FIGURE 5. Stability—Capacitive Load vs Resistive Load.
