## Low Power Optical Mouse Sensor

**Avago**
TECHNOLOGIES

# Data Sheet

### Description

The Avago Technologies ADNS-5030 is a low power, small form factor optical mouse sensor. It has a new low-power architecture and automatic power management modes, making it ideal for battery, power-sensitive applications – such as cordless input devices.

The ADNS-5030 is capable of high-speed motion detection – up to 14 ips and 2G. In addition, it has an on-chip oscillator and LED driver to minimize external components.

The ADNS-5030 along with the ADNS-5100/ADNS-5100-001 lens, ADNS-5200 clip, and HLMP-ED80 LED form a complete and compact mouse tracking system. There are no moving parts, which means high reliability and less maintenance for the end user. In addition, precision optical alignment is not required, facilitating high volume assembly.

The sensor is programmed via registers through a four-wire serial port. It is housed in an 8-pin staggered dual in-line package (DIP).

### Theory of Operation

The ADNS-5030 is based on Optical Navigation Technology, which measures changes in position by optically acquiring sequential surface images (frames) and mathematically determining the direction and magnitude of movement.

The ADNS-5030 contains an Image Acquisition System (IAS), a Digital Signal Processor (DSP), and a four wire serial port.

The IAS acquires microscopic surface images via the lens and illumination system. These images are processed by the DSP to determine the direction and distance of motion. The DSP calculates the $\Delta x$ and $\Delta y$ relative displacement values.

An external microcontroller reads the $\Delta x$ and $\Delta y$ information from the sensor serial port. The microcontroller then translates the data into PS2, USB, or RF signals before sending them to the host PC.

### Features
- Low power architecture
- Small form factor
- Self-adjusting power-saving modes for prolonging battery life
- High speed motion detection up to 14 ips and 2 G
- Self-adjusting frame rate for optimum performance
- Internal oscillator – no clock input needed
- Selectable 500 and 1000 cpi resolution
- Operating voltage: 3.3 V nominal
- Four wire serial port interface
- Minimal number of passive components

### Applications
- Optical mice and optical trackballs
- Integrated input devices
- Battery-powered input devices

## Pinout of ADNS-5030 Optical Mouse Sensor

| Pin | Name | Description |
|-----|------|-------------|
| 1 | MISO | Serial Data Output (Master In/Slave Out) |
| 2 | XY_LED | LED Control |
| 3 | NRESET | Reset Pin (active low input) |
| 4 | NCS | Chip Select (active low input) |
| 5 | SCLK | Serial Clock Input |
| 6 | GND | Ground |
| 7 | VDD3 | Supply Voltage |
| 8 | MOSI | Serial Data Input (Master Out/Slave In) |

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## Overview of Optical Mouse Sensor Assembly

Avago Technologies provides an IGES file drawing describing the base plate molding features for lens and PCB alignment.

The ADNS-5030 sensor is designed for mounting on a through-hole PCB, looking down. There is an aperture stop and features on the package that align to the lens.

The ADNS-5100/5100-001 lens provides optics for the imaging of the surface as well as illumination of the surface at the optimum angle. Features on the lens align it to the sensor, base plate, and clip with the LED.

The ADNS-5200 clip holds the LED in relation to the lens. The LED must be inserted into the clip and the LED's leads formed prior to loading on the PCB.

The HLMP-ED80 LED is recommended for illumination.

## PCB Assembly Considerations

1. Insert the sensor and all other electrical components into PCB.

2. Insert the LED into the assembly clip and bend the leads 90 degrees.

3. Insert the LED clip assembly into PCB.

4. Wave solder the entire assembly in a no-wash solder process utilizing solder fixture. The solder fixture is needed to protect the sensor during the solder process. It also sets the correct sensor-to-PCB distance as the lead shoulders do not normally rest on the PCB surface. The fixture should be designed to expose the sensor leads to solder while shielding the optical aperture from direct solder contact.

5. Place the lens onto the base plate.

6. Remove the protective kapton tape from optical aperture of the sensor. Care must be taken to keep contaminants from entering the aperture. Recommend not to place the PCB facing up during the entire mouse assembly process. Recommend to hold the PCB first vertically for the kapton removal process.

7. Insert PCB assembly over the lens onto the base plate aligning post to retain PCB assembly. The sensor aperture ring should self-align to the lens.

8. The optical position reference for the PCB is set by the base plate and lens. Note that the PCB motion due to button presses must be minimized to maintain optical alignment.

9. Install mouse top case. There MUST be a feature in the top case to press down onto the PCB assembly to ensure all components are interlocked to the correct vertical height.

Figure 6. Block diagram of ADNS-5030 optical mouse sensor.

## Design Considerations for Improved ESD Performance

For improved electrostatic discharge performance, typical creepage and clearance distance are shown in the table below. Assumption: base plate construction as per the Avago Technologies supplied IGES file and ADNS-5100/5100-001 lens.

| Typical Distance | Millimeters |
| --- | --- |
| Creepage | 16.0 |
| Clearance | 2.1 |

Note that the lens material is polycarbonate or polystyrene HH30, therefore, cyanoacrylate based adhesives or other adhesives that may damage the lens should **NOT** be used.
**Figure 7. Sectional view of PCB assembly highlighting optical mouse components.**

**Recommended Typical Application (Receiver Side)**

**Figure 8. Schematic diagram for interface between ADNS-5030 and microcontroller (cordless application).**

## Regulatory Requirements

- Passes FCC B and worldwide analogous emission limits when assembled into a mouse with shielded cable and following Avago Technologies recommendations.

- Passes IEC-1000-4-3 radiated susceptibility level when assembled into a mouse with shielded cable and following Avago Technologies recommendations.

- Passes EN61000-4-4/IEC801-4 EFT tests when assembled into a mouse with shielded cable and following Avago Technologies recommendations.

- UL flammability level UL94 V-0.

- Provides sufficient ESD creepage/clearance distance to avoid discharge up to 15 kV when assembled into a mouse using ADNS-5100 round lens according to usage instructions above.

## Absolute Maximum Ratings

| Parameter | Symbol | Minimum | Maximum | Units | Notes |
|---|---|---|---|---|---|
| Storage Temperature | $T_S$ | -40 | 85 | ºC | |
| Lead Solder Temperature | | | 260 | ºC | |
| Supply Voltage | $V_{DD}$ | -0.5 | 3.7 | V | |
| ESD | | | 2 | kV | All pins, human body model MIL 883 Method 3015 |
| Input Voltage | $V_{IN}$ | -0.5 | $V_{DD} + 0.5$ | V | All I/O pins |
| Output Current | Iout | | 7 | mA | MISO pin |

## Recommended Operating Conditions

| Parameter | Symbol | Minimum | Typical | Maximum | Units | Notes |
|---|---|---|---|---|---|---|
| Operating Temperature | $T_A$ | 0 | | 40 | ºC | |
| Power Supply | $V_{DD}$ | 3.0 | 3.3 | 3.6 | V | |
| Power Supply Rise Time | $V_{RT}$ | 0.005 | | 100 | ms | 0 to $V_{DD}$ min |
| Supply Noise (Sinusoidal) | $V_{NA}$ | | | 100 | mVp-p | 10 kHz - 50 MHz |
| Serial Port Clock Frequency | $f_{SCLK}$ | | | 1 | MHz | 50% duty cycle |
| Distance from Lens Reference Plane to Tracking Surface (Z) | Z | 2.3 | 2.4 | 2.5 | mm | |
| Speed | S | 0 | | 14 | ips | |
| Acceleration | a | | | 2 | G | |
| Load Capacitance | $C_{out}$ | | | 100 | pF | MISO |

**Figure 9. Distance from lens reference plane to tracking surface (Z).**

## AC Electrical Specifications

Electrical Characteristics over recommended operating conditions. Typical values at 25 °C, $V_{DD}$ = 3.3 V.

| Parameter | Symbol | Minimum | Typical | Maximum | Units | Notes |
|---|---|---|---|---|---|---|
| Reset Pulse Width | $t_{RESET}$ | 250 | | | ns | Active low |
| Motion Delay after Reset | $t_{MOT-RST}$ | | | 50 | ms | From NRESET pull high to valid motion, assuming $V_{DD}$ and motion is present |
| Forced Rest Enable | $t_{REST-EN}$ | | | 1 | s | From Rest Mode(RM) bits set to target rest mode |
| Wake from Forced Rest | $t_{REST-DIS}$ | | | 1 | s | From Rest Mode(RM) bits cleared to valid motion |
| Power Down | $t_{PD}$ | | | 50 | ms | From PD (when bit 1 of register 0x0d is set) to low current |
| Wake from Power Down | $t_{WAKEUP}$ | 50 | | 55 | ms | From PD inactive (when NRESET pin is asserted low to high or write 0x5a to register 0x3a) to valid motion |
| MISO Rise Time | $t_{r-MISO}$ | | 40 | 200 | ns | $C_L = 100\,pF$ |
| MISO Fall Time | $t_{f-MISO}$ | | 40 | 200 | ns | $C_L = 100\,pF$ |
| MISO Delay after SCLK | $t_{DLY-MISO}$ | | | 120 | ns | From SCLK falling edge to MISO data valid, no load conditions |
| MISO Hold Time | $t_{hold-MISO}$ | 0.5 | | $1/f_{SCLK}$ | µs | Data held until next falling SCLK edge |
| MOSI Hold Time | $t_{hold-MOSI}$ | 200 | | | ns | Amount of time data is valid after SCLK rising edge |
| MOSI Setup Time | $t_{setup-MOSI}$ | 120 | | | ns | From data valid to SCLK rising edge |
| SPI Time between Write Commands | $t_{SWW}$ | 30 | | | µs | From rising SCLK for last bit of the first data byte, to rising SCLK for last bit of the second data byte |
| SPI Time between Write and Read Commands | $t_{SWR}$ | 20 | | | µs | From rising SCLK for last bit of the first data byte, to rising SCLK for last bit of the second address byte |
| SPI Time between Read and Subsequent Commands | $t_{SRW}$ $t_{SRR}$ | 250 | | | ns | From rising SCLK for last bit of the first data byte, to falling SCLK for the first bit of the next address |
| SPI Read Address-Data Delay | $t_{SRAD}$ | 4 | | | µs | From rising SCLK for last bit of the address byte, to falling SCLK for first bit of data being read |
| NCS Inactive after Motion Burst | $t_{BEXIT}$ | 250 | | | ns | Minimum NCS inactive time after motion burst before next SPI usage |
| NCS to SCLK Active | $t_{NCS-SCLK}$ | 120 | | | ns | From NCS falling edge to first SCLK rising edge |
| SCLK to NCS Inactive (for Read Operation) | $t_{SCLK-NCS}$ | 120 | | | ns | From last SCLK rising edge to NCS rising edge, for valid MISO data transfer |
| SCLK to NCS Inactive (for Write Operation) | $t_{SCLK-NCS}$ | 20 | | | µs | From last SCLK rising edge to NCS rising edge, for valid MOSI data transfer |
| NCS to MISO high-Z | $t_{NCS-MISO}$ | | | 250 | ns | From NCS rising edge to MISO high-Z state |
| Transient Supply Current | $I_{DDT}$ | | | 60 | mA | Max supply current during a $V_{DD}$ ramp from 0 to $V_{DD}$ |

## DC Electrical Specifications

Electrical Characteristics over recommended operating conditions. Typical values at 25°C, $V_{DD} = 3.3$ V.

| Parameter | Symbol | Minimum | Typical | Maximum | Units | Notes |
|-----------|--------|---------|---------|---------|-------|-------|
| DC Supply Current in Various Mode | $I_{DD\_AVG\_HIGH}$ | | 15.2 | 17 | mA | Average current, including LED current, at max frame rate. No load on MISO. Bit 0 of register 0x40 set to "0" |
| | $I_{DD\_AVG\_LOW}$ | | 11.3 | 13.1 | mA | Average current, including LED current, at max frame rate. No load on MISO. Bit 0 of register 0x40 set to "1" |
| | $I_{DD\_REST1}$ | | 0.34 | 0.54 | mA | |
| | $I_{DD\_REST2}$ | | 0.09 | 0.16 | mA | |
| | $I_{DD\_REST3}$ | | 0.03 | 0.06 | mA | |
| Power Down | | | 2 | | uA | |
| Input Low Voltage | $V_{IL}$ | | | 0.5 | V | SCLK, MOSI, NCS, NRESET |
| Input High Voltage | $V_{IH}$ | $V_{DD} - 0.5$ | | | V | SCLK, MOSI, NCS, NRESET |
| Input hysteresis | $V_{I\_HYS}$ | | 200 | | mV | SCLK, MOSI, NCS, NRESET |
| Input leakage current | $I_{leak}$ | | ±1 | ±10 | mA | Vin=VDD-0.6V, SCLK, MOSI, NCS, NRESET |
| Output Low Voltage | $V_{OL}$ | | | 0.7 | V | Iout=1mA, MISO |
| Output High Voltage | $V_{OH}$ | VDD -0.7 | | | V | Iout=-1mA, MISO |
| Input Capacitance | $C_{in}$ | | 50 | | pF | MOSI, NCS, SCLK, NRESET |

## Typical Performance Characteristics (Bit 0 of register 0x40 set to "0")

Figure 11. Typical path deviation.

Figure 12. Relative wavelength responsivity.

## Power Management Modes

The ADNS-5030 has three power-saving modes. Each mode has a different motion detection period, affecting response time to mouse motion (Response Time). The sensor automatically changes to the appropriate mode, depending on the time since the last reported motion (Downshift Time). The parameters of each mode are shown in the following table.

| Mode | Response Time (Typical) | Downshift Time (Typical) |
|---|---|---|
| Rest 1 | 14 ms | <1s |
| Rest 2 | 68 ms | 7 s |
| Rest 3 | 340 ms | 410 s |

## LED Mode

For power savings, the LED will not be continuously on. ADNS-5030 will pulse the LED only when needed.

## Synchronous Serial Port

The synchronous serial port is used to set and read parameters in the ADNS-5030, and to read out the motion information.

The port is a four wire serial port. The host micro-controller always initiates communication; the ADNS-5030 never initiates data transfers. SCLK, MOSI, and NCS may be driven directly by a micro-controller. The port pins may be shared with other SPI slave devices. When the NCS pin is high, the inputs are ignored and the output is tri-stated.

The lines that comprise the SPI port:

SCLK: Clock input. It is always generated by the master (the micro-controller).

MOSI: Input data. (Master Out/Slave In)

MISO: Output data. (Master In/Slave Out)

NCS: Chip select input (active low). NCS needs to be low to activate the serial port; otherwise, MISO will be high Z, and MOSI & SCLK will be ignored. NCS can also be used to reset the serial port in case of an error.

## Chip Select Operation

The serial port is activated after NCS goes low. If NCS is raised during a transaction, the entire transaction is aborted and the serial port will be reset. This is true for all transactions. After a transaction is aborted, the normal address-to-data or transaction-to-transaction delay is still required before beginning the next transaction. To improve communication reliability, all serial transactions should be framed by NCS. In other words, the port should not remain enabled during periods of non-use because ESD and EFT/B events could be interpreted as serial communication and put the chip into an unknown state. In addition, NCS must be raised after each burst-mode transaction is complete to terminate burst-mode. The port is not available for further use until burst-mode is terminated.

## Write Operation

Write operation, defined as data going from the micro-controller to the ADNS-5030, is always initiated by the micro-controller and consists of two bytes. The first byte contains the address (seven bits) and has a "1" as its MSB to indicate data direction. The second byte contains the data. The ADNS-5030 reads MOSI on rising edges of SCLK.

MOSI DRIVEN BY MICRO-CONTROLLER
## Write Operation
**MOSI Setup and Hold Time**

## Read Operation

A read operation, defined as data going from the ADNS-5030 to the micro-controller, is always initiated by the micro-controller and consists of two bytes. The first byte contains the address, is sent by the micro-controller over MOSI, and has a "0" as its MSB to indicate data direction. The second byte contains the data and is driven by the ADNS-5030 over MISO. The sensor outputs MISO bits on falling edges of SCLK and samples MOSI bits on every rising edge of SCLK.

**Read Operation**

**MISO Delay and Hold Time**

**NOTE:** The 200 ns minimum high state of SCLK is also the minimum MISO data hold time of the ADNS-5030. Since the falling edge of SCLK is actually the start of the next read or write command, the ADNS-5030 will hold the state of data on MISO until the falling edge of SCLK.

12

## Required Timing between Read and Write Commands

There are minimum timing requirements between read and write commands on the serial port.

SCLK

ADDRESS    DATA    ADDRESS    DATA
$t_{SWW}$

WRITE OPERATION    WRITE OPERATION
## Timing between Two Write Commands

If the rising edge of the SCLK for the last data bit of the second write command occurs before the required delay ($t_{SWW}$), then the first write command may not complete correctly.

SCLK

ADDRESS    DATA    ADDRESS
$t_{SWR}$

WRITE OPERATION    NEXT READ OPERATION
## Timing between Write and Read Commands

If the rising edge of SCLK for the last address bit of the read command occurs before the required delay ($t_{SWR}$), the write command may not complete correctly.

SCLK

ADDRESS    DATA    ADDRESS
$t_{SRAD}$    $t_{SRW}$ & $t_{SRR}$

READ OPERATION    NEXT READ or WRITE OPERATION

## Timing between Read and Either Write or Subsequent Read Commands

During a read operation SCLK should be delayed at least $t_{SRAD}$ after the last address data bit to ensure that the ADNS-5030 has time to prepare the requested data. The falling edge of SCLK for the first address bit of either the read or write command must be at least $t_{SRR}$ or $t_{SRW}$ after the last SCLK rising edge of the last data bit of the previous read operation.

## Motion Burst Timing

## Burst Mode Operation

Burst mode is a special serial port operation mode that may be used to reduce the serial transaction time for a motion read. The speed improvement is achieved by continuous data clocking to or from multiple registers without the need to specify the register address, and by not requiring the normal delay period between data bytes.

Burst mode is activated by reading the Motion_Burst register. The ADNS-5030 will respond with the contents of the Delta_X, Delta_Y, SQUAL, Shutter_Upper, Shutter_Lower, and Maximum_Pixel and Pixel_Sum registers in that order. The burst transaction can be terminated anywhere in the sequence after the Delta_X value by bringing the NCS pin high. After sending the register address, the micro-controller must wait $t_{SRAD}$ and then begin reading data. All data bits can be read with no delay between bytes by driving SCLK at the normal rate. The data are latched into the output buffer after the last address bit is received. After the burst transmission is complete, the micro-controller must raise the NCS line for at least $t_{BEXIT}$ to terminate burst mode. The serial port is not available for use until it is reset with NCS, even for a second burst transmission.

Avago Technologies highly recommends the usage of burst mode operation in optical mouse sensor design applications.

## Notes on Power-up and Reset

The ADNS-5030 does not perform an internal power up self-reset; the NRESET pin must be asserted low every time power is applied. There are two ways to reset the chip, either assert low NRESET pin or by writing 0x5a to register 0x3a. A full reset will thus be executed. Any register settings must then be reloaded.

During power-up there will be a period of time after the power supply is high but before any clocks are available. The table below shows the state of the various pins during power-up and reset.

State of Signal Pins after VDD is Valid

| Pin | During Reset | After Reset |
|---|---|---|
| NCS | Ignored | Functional |
| MISO | Low | Depends on NCS |
| SCLK | Ignored | Depends on NCS |
| MOSI | Ignored | Depends on NCS |
| XY_LED | High | Functional |

## Notes on Power Down

The ADNS-5030 can be set in Power Down mode by setting bit 1 of Register 0x0d. In addition, the SPI port should not be accessed during power down. (Other ICs on the same SPI bus can be accessed, as long as the sensor's NCS pin is not asserted.) The table below shows the state of various pins during power down. There are 2 ways to exit power down, either assert low NRESET pin or by writing 0x5a to Register 0x3a. A full reset will thus be executed. Wait $t_{WAKEUP}$ before accessing the SPI port. Any register settings must then be reloaded.

| Pin | Power Down Active |
|---|---|
| NRESET | Functional |
| NCS | Functional* |
| MISO | Undefined |
| SCLK | Functional* |
| MOSI | Functional* |
| XY_LED | Low current |

\* NCS pin must be held to 1 (high) if SPI bus is shared with other devices. It can be in either state if the sensor is the only device in addition to the controller microprocessor.

Note: There is long wakeup time from power down. This feature should not be used for power management during normal mouse motion.

## Registers

The ADNS-5030 registers are accessible via the serial port. The registers are used to read motion data and status as well as to set the device configuration.

| Address | Register | Read/Write | Default Value |
|---|---|---|---|
| 0x00 | Product_ID | R | 0x11 |
| 0x01 | Revision_ID | R | 0x00 |
| 0x02 | Motion | R | 0x00 |
| 0x03 | Delta_X | R | Any |
| 0x04 | Delta_Y | R | Any |
| 0x05 | SQUAL | R | Any |
| 0x06 | Shutter_Upper | R | Any |
| 0x07 | Shutter_Lower | R | Any |
| 0x08 | Maximum_Pixel | R | Any |
| 0x09 | Pixel_Sum | R | Any |
| 0x0a | Minimum_Pixel | R | Any |
| 0x0b | Pixel_Grab | R/W | Any |
| 0x0c | Reserved | | |
| 0x0d | Mouse Control | R/W | 0x00 |
| 0x0e – 0x39 | Reserved | | |
| 0x3a | Chip_Reset | W | N/A |
| 0x3b – 0x3e | Reserved | | |
| 0x3f | Inv_Rev_ID | R | 0xff |
| 0x40 | Sensor_Current_Setting | W | N/A |
| 0x41 – 0x44 | Reserved | | |
| 0x45 | Rest_mode_configuration | R/W | 0x00 |
| 0x46 – 0x62 | Reserved | | |
| 0x63 | Motion_Burst | R | 0x00 |

**Product_ID**                    Address: 0x00
 Access: Read                    Reset Value: 0x11

| Bit   | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|---|---|---|---|---|---|---|---|
| Field | $PID_7$ | $PID_6$ | $PID_5$ | $PID_4$ | $PID_3$ | $PID_2$ | $PID_1$ | $PID_0$ |

Data Type:     8-Bit unsigned integer

USAGE:         This register contains a unique identification assigned to the ADNS-5030. The value in this register does not change; it can be used to verify that the serial communications link is functional.

**Revision_ID**                    Address: 0x01
 Access: Read                    Reset Value: 0x00

| Bit   | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|---|---|---|---|---|---|---|---|
| Field | $RID_7$ | $RID_6$ | $RID_5$ | $RID_4$ | $RID_3$ | $RID_2$ | $RID_1$ | $RID_0$ |

Data Type:     8-Bit unsigned integer

USAGE:         This register contains the IC revision. It is subject to change when new IC versions are released.

**Motion**                    Address: 0x02
 Access: Read/Write           Reset Value: 0x00

| Bit   | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|---|---|---|---|---|---|---|---|
| Field | MOT | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved |

Data Type:     Bit field

USAGE:         Register 0x02 allows the user to determine if motion has occurred since the last time it was read. If the MOT bit is set, then the user should read registers 0x03 and 0x04 to get the accumulated motion. Read this register before reading the Delta_X and Delta_Y registers.

Writing anything to this register clears the MOT bit, Delta_X and Delta_Y registers. The written data byte is not saved.

| Field Name | Description |
|------------|-------------|
| MOT | Motion since last report<br>**0 = No motion**<br>1 = Motion occurred, data ready for reading in Delta_X and Delta_Y registers |
| Reserved | Reserved |

16

**Delta X**           Address: 0x03

Access: Read         Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Field | $X_7$ | $X_6$ | $X_5$ | $X_4$ | $X_3$ | $X_2$ | $X_1$ | $X_0$ |

Data Type:      Eight bit 2's complement number

USAGE:       X movement is counts since last report. Absolute value is determined by resolution. Reading clears the register.

| MOTION | -128 | -127 | | -2 | -1 | 0 | +1 | +2 | | +126 | +127 |

**NOTE: Avago Technologies RECOMMENDS that registers 0x03 and 0x04 be read sequentially.**

| **Squal** | | Address: 0x05 | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Access: Read | | Reset Value: 0x00 | | | | | | |

| **Bit** | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| **Field** | $SQ_7$ | $SQ_6$ | $SQ_5$ | $SQ_4$ | $SQ_3$ | $SQ_2$ | $SQ_1$ | $SQ_0$ |

Data Type: Upper 8 bits of a 9-bit unsigned integer

USAGE: SQUAL (Surface Quality) is a measure of the number of valid features visible by the sensor in the current frame.

The maximum SQUAL register value is 144. Since small changes in the current frame can result in changes in SQUAL, variations in SQUAL when looking at a surface are expected. The graph below shows 250 sequentially acquired SQUAL values, while a sensor was moved slowly over white paper. SQUAL is nearly equal to zero, if there is no surface below the sensor. SQUAL is typically maximized when the navigation surface is at the optimum distance from the imaging lens (the nominal Z-height).

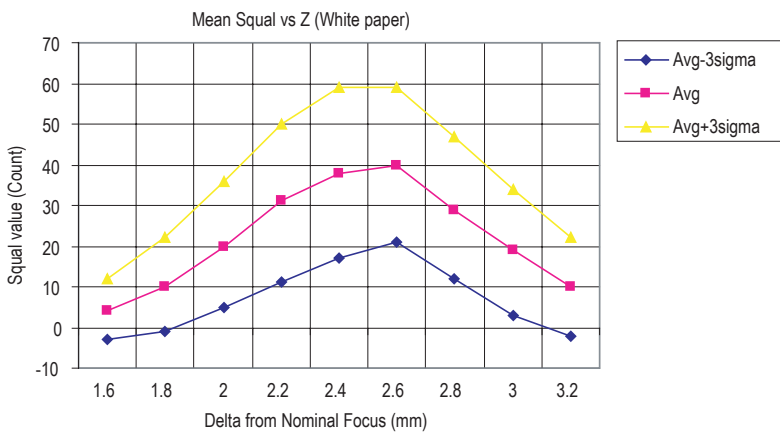

**Figure 13. Squal values (white paper).**

**Figure 14. Mean squal vs. Z (white paper).**

18

**Shutter_Upper**

Access: Read

Address: 0x06

Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|-----|-----|-----|-----|-----|-----|-----|-----|
| Field | $S_{15}$ | $S_{14}$ | $S_{13}$ | $S_{12}$ | $S_{11}$ | $S_{10}$ | $S_9$ | $S_8$ |

**Shutter_Lower**

Access: Read

Address: 0x07

Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|-----|-----|-----|-----|-----|-----|-----|-----|
| Field | $S_7$ | $S_6$ | $S_5$ | $S_4$ | $S_3$ | $S_2$ | $S_1$ | $S_0$ |

Data Type: Sixteen bit unsigned integer

USAGE: Units are clock cycles. Read Shutter_Upper first, then Shutter_Lower. They should be read consecutively. The shutter is adjusted to keep the average and maximum pixel values within normal operating ranges. The shutter value is automatically adjusted.

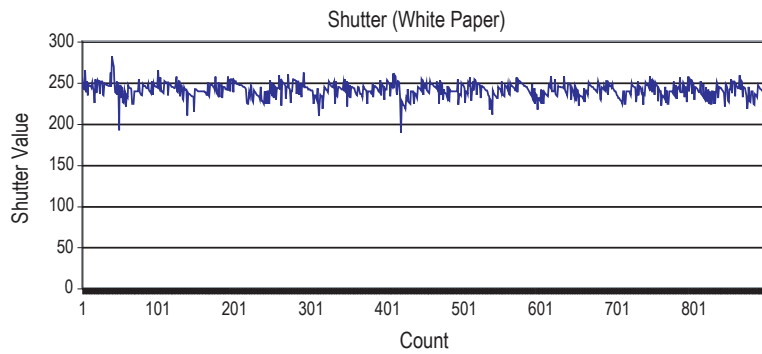

Figure 15. Shutter (white paper).

Figure 16. Mean shutter vs. Z (white paper).

**Maximum_Pixel**  Address: 0x08

Access: Read  Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Field | $MP_0$ | $MP_6$ | $MP_5$ | $MP_4$ | $MP_3$ | $MP_2$ | $MP_1$ | $MP_0$ |

Data Type:  Eight-bit number

USAGE:  Maximum Pixel value in current frame. Minimum value = 0, maximum value = 127. The maximum pixel value can vary with every frame.

---

**Pixel_Sum**  Address: 0x09

Access: Read  Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Field | $AP_7$ | $AP_6$ | $AP_5$ | $AP_4$ | $AP_3$ | $AP_2$ | $AP_1$ | $AP_0$ |

Data Type:  High 8 bits of an unsigned 15-bit integer

USAGE:  This register is the accumulated pixel value from the last image taken. The maximum accumulator value is 28,575, but only bits [14:7] are reported. It may be described as the full sum divided by 1.76.

The maximum register value is 223. The minimum is 0. The pixel sum value can change on every frame.

---

**Minimum_Pixel**  Address: 0x0a

Access: Read  Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Field | $MP_0$ | $MP_6$ | $MP_5$ | $MP_4$ | $MP_3$ | $MP_2$ | $MP_1$ | $MP_0$ |

Data Type:  Eight-bit number

USAGE:  Minimum Pixel value in current frame. Minimum value = 0, maximum value = 127. The minimum pixel value can vary with every frame.

**Pixel_Grab**  Address: 0x0b

Access: Read/Write  Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Field | Valid | $PD_6$ | $PD_5$ | $PD_4$ | $PD_3$ | $PD_2$ | $PD_1$ | $PD_0$ |

Data Type:  Eight-bit word

USAGE:  The pixel grabber captures 1 pixel per frame. If there is a valid pixel in the grabber when this register is read, the MSB will be set, an internal counter will incremented to capture the next pixel and the grabber will be armed to capture the next pixel. It will take 225 reads to upload the complete image.

Any write to this register will reset and arm the grabber to grab pixel 0 on the next image.

## Physical Pixel Address Map – readout order of the array

(looking through the sensor aperture at the bottom of the package)

|---|---|---|---|---|---|---|---|---|
| Field | $RM_1$ | $RM_0$ | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved |

Data Type:      Bit field

USAGE:         Register 0x45 allows the user to change or monitor the rest mode configuration of the sensor. Write operations to $RM_1$ and $RM_0$ forces the sensor into rest mode. Read $RM_1$ and $RM_0$ for the sensor to report which mode it is in.

*Note: Forced Rest has a long wakeup time and should not be used for power management during normal mouse motion.*

| Field Name | Description |
|---|---|
| $RM_{[1-0]}$ | Write operation: Force rest mode selection<br>**00 = Normal operation**<br>01 = Rest1<br>10 = Rest2<br>11 = Rest3 |
| $RM_{[1-0]}$ | Read operation: Reports which mode the sensor is in.<br>**00 = Run**<br>01 = Rest1<br>10 = Rest2<br>11 = Rest3 |
| Reserved | Reserved |

**Reserved**                     Address: 0x46-0x62

**Motion_Burst**        Address: 0x63

Access: Read            Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Field | $MB_7$ | $MB_6$ | $MB_5$ | $MB_4$ | $MB_3$ | $MB_2$ | $MB_1$ | $MB_0$ |

Data Type:     Various

USAGE:        Read from this register to activate burst mode. The sensor will return the data in the Delta_X, Delta_Y, Squal, Shutter_Upper, Shutter_Lower, Maximum_Pixel and Pixel_Sum. If the burst is not terminated at this point, the internal address counter stops incrementing and Pixel Sum register's value will be continuously returned. Bursts are terminated when NCS is raised.
