## DESCRIPTION

The SC1534 is designed to maintain a glitch-free 3.3V output when at least one of two inputs, 5V (VIN) and 3.3V (VAUX), is present.

Whenever VIN exceeds a predetermined threshold value, the internal 3.3V linear regulator is enabled, and DR is pulled high.

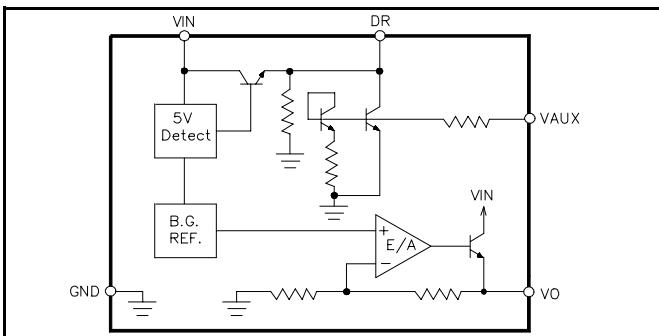

When VIN falls below a lower threshold value, DR is pulled low and the internal linear regulator is turned off. DR has been designed to drive the gate of an external low threshold P-channel MOSFET, which can be used to connect the 3.3V supply directly to the regulator output. This ensures an uninterrupted 3.3V output even if VIN falls out of specification. A maximum  $R_{DS(ON)}$  of 200mΩ is recommended.

When both supplies are simultaneously available, the drive pin (DR) will be pulled High, turning off the external PMOS switch.

The internal 5V detector has its upper threshold (for VIN rising) set to 4.22V (typical) while the lower threshold (for VIN falling) is at 4.05V (typical) giving a hysteresis of approximately 170mV.

The SC1534 is available in the popular SO-8 and 5-lead TO-263 surface mount packages.

## FEATURES

- Glitch-free transition between input sources
- Internal logic selects input source
- Gate drive for external PMOS bypass switch
- 5V detector with hysteresis
- 1% regulated output voltage accuracy
- 400mA load current capability
- SO-8 and TO-263 packages

## APPLICATIONS

- Desktop Computers
- Network Interface Cards (NICs)
- PCMCIA/PCI Interface Cards
- Cardbus™ Technology
- Power supplies with multiple input sources

## PIN DESCRIPTION

Pin Name	SO-8 Pin #	TO-263-5L Pin #	Pin Function
DR	4	5	Driver output for external P-channel MOSFET pass element.
GND	5,6,7,8	3/TAB	Logic and power ground.
VAUX	1	1	This is the auxiliary input supply, nominally 3.3V.
VIN	2	2	This is the main input supply for the IC, nominally 5V.
VO	3	4	LDO 3.3V output.

## APPLICATION CIRCUIT

### NOTE:

- (1) External switch (Q1): use a low threshold P-channel MOSFET such as Fairchild FDN338P or International Rectifier IRF7604, or equivalent. (PMOS, typical gate threshold voltage  $\leq 1V$ ,  $R_{DS(ON)} < 200m\Omega$  at  $V_{GS} = 2.7V$ ).

**NOTES:**

- (1) Guaranteed by design.
- (2) See 5V Detect Thresholds on page 5.
- (3) Recommended source impedance for 5V supply:  $\leq 0.125\Omega$ . This will ensure that  $I_O \times R_{SOURCE} < V_{HYST}$ , thus avoiding DR toggling during 5V detect threshold transitions.
- (4) See Timing Diagram on page 5.
