

NCP5500, NCV5500, NCP5501, NCV5501

500 mA LDO Voltage Regulator

These linear low drop voltage regulators provide up to 500 mA over a user-adjustable output range of 1.25 V to 5.0 V, or at a fixed output voltage of 1.5 V, 3.3 V or 5.0 V, with typical output voltage accuracy better than 3%. An internal PNP pass transistor permits low dropout voltage and operation at full load current at the minimum input voltage. NCV versions are qualified for demanding automotive applications that require extended temperature operation and site and change control. NCP5500 and NCV5500 versions include an Enable/Shutdown function and are available in a DPAK 5 and SOIC 8 packages. NCP5501 and NCV5501 versions are available in DPAK 3 packages that do not require logical on/off control.

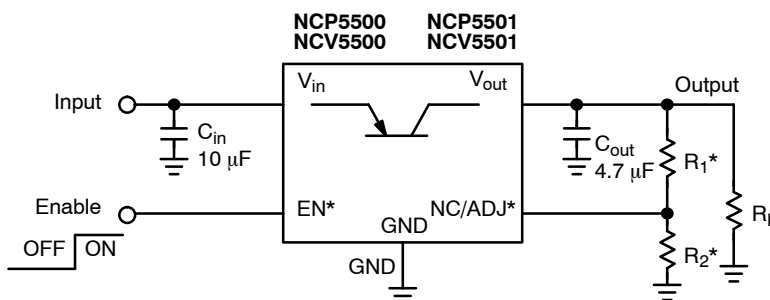

This regulator family is ideal for applications that require a broad input voltage range, and low dropout performance up to 500 mA load using low cost ceramic capacitors. Integral protection features include short circuit current and thermal shutdown.

Features

- Output Current up to 500 mA
- 2.9% Output Voltage Accuracy
- Low Dropout Voltage (230 mV at 500 mA)
- Enable Control Pin (NCP5500 / NCV5500)
- Reverse Bias Protection
- Short Circuit Protection
- Thermal Shutdown
- Wide Operating Temperature Range
NCV5500 / NCV5501; -40°C to +125°C Ambient Temperature
NCP5500 / NCP5501; -40°C to +85°C Ambient Temperature
- NCV Prefix for Applications that Require Site and Change Control
- Stable with Low Cost Ceramic Capacitors
- These are Pb-Free Devices

Typical Applications

- Automotive
- Industrial and Consumer
- Post SMPS Regulation
- Point of Use Regulation

*Applicable to NCP5500/NCV5500 only.

PIN FUNCTION DESCRIPTIONS

Pin No.	Pin No.	Pin No.	Pin Name	Description
-	1	8	EN	Enable. This pin allows for on/off control of the regulator. High level turns on the output. To disable the device, connect to ground. If this function is not in use, connect to V_{in} .
1	2	1	V_{in}	Positive power supply input voltage.
2, Tab	3, Tab	2, 3, 6, 7	GND	Ground. This pin is internally connected to the Tab heat sink.
3	4	4	V_{out}	Regulated output voltage.
-	5	5	NC/ADJ	No connection (Fixed output versions). Voltage-adjust input (Adjustable output version). Use an external voltage divider to set the output voltage over a range of 1.25 V to 5.0 V.

8. Deviation from nominal. For adjustable versions, Pin ADJ connected to V_{out} .

9. See Typical Characteristics section for additional information.

10. V_{DO} is constrained by the minimum input voltage of 2.5 V.

11. V_{out} is set by external resistor divider to 5 V.

12. V_n for other fixed voltage versions, as well as adjustable versions set to other output voltages, can be calculated from the following formula:

$$V_n = V_{n(x)} * V_{out} / 1.25, \text{ where } V_{n(x)} \text{ is the typical value from the table above.}$$

13. Performance guaranteed over specified operating conditions by design, guard banded test limits, and/or characterization, production tested at $T_J = T_A = 25^\circ\text{C}$. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.

14. Values are based on design and/or characterization.

Figure 21. Measuring Circuits

Circuit Description

The NCP5500/NCP5501/NCV5500/NCV5501 are integrated linear regulators with a DC load current capability of 500 mA. The output voltage is regulated by a PNP pass transistor controlled by an error amplifier and band gap reference. The choice of a PNP pass element provides the lowest possible dropout voltage, particularly at reduced load currents. Pass transistor base drive current is controlled to prevent oversaturation. The regulator is internally protected by both current limit and thermal shutdown. Thermal shutdown occurs when the junction temperature exceeds 150°C. The NCV5500 includes an enable/shutdown pin to turn off the regulator to a low current drain standby state.

Regulator

The error amplifier compares the reference voltage to a sample of the output voltage (V_{out}) and drives the base of a PNP series pass transistor via a buffer. The reference is a bandgap design for enhanced temperature stability. Saturation control of the PNP pass transistor is a function of the load current and input voltage. Oversaturation of the output power device is prevented, and quiescent current in the ground pin is minimized.

Regulator Stability Considerations

The input capacitor is necessary to stabilize the input impedance to reduce transient line influences. The output capacitor helps determine three main characteristics of a

linear regulator: startup delay, load transient response and loop stability. The capacitor value and type should be based on cost, availability, size and temperature constraints. Refer to Typical Operating Characteristics for stability regions.

Enable Input (NCP5500, NCV5500)

The enable pin is used to turn the regulator on or off. By holding the pin at a voltage less than 0.4 V, the output of the regulator will be turned off to a minimal current drain state. When the voltage at the Enable pin is greater than 2.0 V, the output of the regulator will be enabled and rise to the regulated output voltage. The Enable pin may be connected directly to the input pin to provide a constant enable to the regulator.

Active Load Protection in Shutdown (NCP5500, NCV5500)

When a linear regulator is disabled (shutdown), the output (load) voltage should be zero. However, stray PC board leakage paths, output capacitor dielectric absorption, and inductively coupled power sources can cause an undesirable regulator output voltage if load current is low or zero. The NCV5500 features a load protection network that is active only during Shutdown mode. This network switches in a shunt current path (~500 μA) from V_{out} to Ground. This feature also provides a controlled (“soft”) discharge path for the output capacitor after a transition from Enable to Shutdown.

Calculating Resistors for the ADJ Versions

The adjustable version uses feedback resistors to adjust the output to the desired output voltage. With V_{out} connected to ADJ, the adjustable version will regulate at 1.25 V $\pm 4.9\%$ (1250 \pm 61.25 mV).

Output voltage formula with an external resistor divider:

$$V_{out} = \left(1.25 \text{ V} - \left[60\text{E-}9 \cdot \frac{(R_1 \cdot R_2)}{(R_1 + R_2)} \right] \right) \cdot \left(\frac{(R_1 + R_2)}{R_2} \right)$$

Where

R_1 = value of the divider resistor connected between V_{out} and ADJ,

R_2 = value of the divider resistor connected between ADJ and GND,

The term “1.25 V” has a tolerance of $\pm 4.9\%$; the term “60E-9” can vary in the range 15E-9 to 60E-9.

For values of R_2 less than 15 K Ω , the term within brackets ([]) will evaluate to less than 1 mV and can be ignored. This simplifies the output voltage formula to:

$V_{out} = 1.25 \text{ V} * ((R_1 + R_2) / R_2)$ with a tolerance of $\pm 4.9\%$, which is the tolerance of the 1.25 V output when delivering up to 500 mA of output current.

DEFINITION OF TERMS

Dropout Voltage: The input-to-output voltage differential at which the circuit ceases to regulate against further reduction input voltage. Measured when the output voltage has dropped 2% relative to the value measured at nominal input voltage. Dropout voltage is dependent upon load current and junction temperature.

Input Voltage: The DC voltage applied to the input terminals with respect to ground.

Line Regulation: The change in output voltage for a change in the input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that the average chip temperature is not significantly affected.

Load Regulation: The change in output voltage for a change in load current at constant chip temperature. Pulse loading techniques are employed such that the average chip temperature is not significantly affected.

Quiescent and Ground Current: The quiescent current is the current which flows through the ground when the LDO operates without a load on its output: internal IC operation, bias, etc. When the LDO becomes loaded, this term is called the Ground current. It is actually the difference between the input current (measured through the LDO input pin) and the output current.

Ripple Rejection: The ratio of the peak-to-peak input ripple voltage to the peak-to-peak output ripple voltage.

Current Limit: Peak current that can be delivered to the output.

Calculating Power Dissipation

The maximum power dissipation for a single output regulator (Figure 21) is:

$$P_{D(max)} = [V_{in(max)} - V_{out(min)}] I_{out(max)} + V_{in(max)} I_{GND} \tag{eq. 1}$$

Where

$V_{in(max)}$ is the maximum input voltage,

$V_{out(min)}$ is the minimum output voltage,

$I_{out(max)}$ is the maximum output current for the application,

I_{GND} is the ground current at $I_{out(max)}$.

Once the value of $P_{D(max)}$ is known, the maximum permissible value of $R_{\theta JA}$ can be calculated:

$$R_{\theta JA} = \frac{(150^\circ\text{C} - T_A)}{P_D} \tag{eq. 2}$$

The value of $R_{\theta JA}$ can then be compared with those in the Thermal Characteristics table. Those packages with $R_{\theta JA}$ less than the calculated value in Equation 2 will keep the die temperature below 150°C.

In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heat sink will be required.

Heat Sinks

A heat sink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air.

Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of $R_{\theta JA}$:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \tag{eq. 3}$$

where

$R_{\theta JC}$ is the junction-to-case thermal resistance,

$R_{\theta CS}$ is the case-to-heatsink thermal resistance,

$R_{\theta SA}$ is the heatsink-to-ambient thermal resistance.

$R_{\theta JC}$ appears in the Thermal Characteristics table. Like $R_{\theta JA}$, it too is a function of package type. $R_{\theta CS}$ and $R_{\theta SA}$ are functions of the package type, heat sink and the interface between them. These values appear in data sheets of heat sink manufacturers.

Thermal, mounting, and heat sink considerations are further discussed in ON Semiconductor Application Note AN1040/D.

2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751-01 THRU 751-06 ARE OBSOLETE. NEW STANDARD IS 751-07.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	4.80	5.00	0.189	0.197
B	3.80	4.00	0.150	0.157
C	1.35	1.75	0.053	0.069
D	0.33	0.51	0.013	0.020
G	1.27 BSC		0.050 BSC	
H	0.10	0.25	0.004	0.010
J	0.19	0.25	0.007	0.010
K	0.40	1.27	0.016	0.050
M	0°	8°	0°	8°
N	0.25	0.50	0.010	0.020
S	5.80	6.20	0.228	0.244

SOLDERING FOOTPRINT*

SCALE 6:1 (mm/inches)
